**Figure A**

The graph illustrates the relative proliferation of cells treated with either CT or Anti-FGFR3 compared to controls. The y-axis represents relative proliferation, and the x-axis shows different treatments: CT, Anti-FGFR3, and two conditions labeled CT and FGFR3-IIIc. The Anti-FGFR3 treatment shows a significant increase in proliferation compared to CT, as indicated by the *** symbol.

**Figure B**

The bar graph compares the tumor mass (in mg) between CT and FGFR3-IIIc treatments. The y-axis represents tumor mass, and the x-axis shows the treatments: CT and FGFR3-IIIc. The FGFR3-IIIc treatment results in a significantly reduced tumor mass, as indicated by the ** symbol.
