The graph shows the effect of LPS and LPS + CAM (µg/ml) on NO$_2^-$/NO$_3^-$ levels (mean µM ± SE). The levels are significantly higher for LPS alone compared to Med. alone and LPS + CAM at concentrations of 0.2, 0.4, 0.6, 0.8, 1.0, and 1.2 µg/ml. The differences are statistically significant at P < 0.05.
