Supplemented data, Figure 3. Immunolocalization with the preimmune fertilin antibody on epididymal sperm (A) from caput and (B) from cauda. Spermatozoa were incubated with the preimmune polyclonal serum as described in the materials and methods and revealed with a second anti-rabbit alexa fluor 488 conjugated fluorescent antibody. Sperm were from the same animal and the observations were done at x 630 magnifications. Only a fuzzy low intensity labeling could be observed.
