The graph illustrates the percentage of self-reported CVD among Indigenous and non-Indigenous populations across different age groups. The age groups considered are 18-24, 25-34, 35-44, 45-54, and 55-64 years.

- **18-24 years**: A small percentage of both Indigenous and non-Indigenous individuals report CVD.
- **25-34 years**: There is a notable increase in self-reported CVD among both populations, with a slightly higher percentage among Indigenous individuals.
- **35-44 years**: The percentage remains relatively consistent, with a marginal increase in self-reporting among Indigenous individuals.
- **45-54 years**: A significant increase is observed, particularly among Indigenous individuals, with a substantial rise in self-reporting.
- **55-64 years**: The highest percentage of self-reported CVD is observed in this age group, with a markedly higher rate among Indigenous individuals compared to non-Indigenous individuals.
