Figure 3S. Immunohistochemical staining of EMT-related markers in lymph nodes metastases. Exemplary results of negative and positive staining of E-cadherin (membrane staining), vimentin (cytoplasmic staining), TWIST1 (nuclear staining), SLUG (nuclear staining) and SNAIL (nuclear staining). Arrows indicate tumor cells either negative or positive for a particular protein on respective photos. Immunostaining of SNAIL produced cytoplasmic background staining in some cells, but only cells with nuclear protein accumulation indicative of transcriptional activity were considered positive.
