The graphs depict the changes in different parameters over time with rh-HGF dosing and observation periods. The parameters include:

- PT-INR
- T-Bil (mg/dL)
- serum albumin (g/dL)
- ALT (IU/L)
- AFP (ng/ml)

Each graph shows the trends for different patients, identified as #1, #2, #3, and #4, with three observation periods: 1, 8, and 14 days. The graphs indicate variations in the parameters across these observation periods, highlighting the effects of rh-HGF dosing.
