Figure 5

The graph represents the average visual score for various locations: basal, medial, apical, apex, 4ch, and 2ch, during rest and stress conditions.

- Basal: Rest score is slightly lower than stress score, with a small standard deviation.
- Medial: Similar trend as basal, with a slightly higher rest score and a relatively small standard deviation.
- Apical: Rest score is slightly higher than stress score, with a larger standard deviation.
- Apex: Rest score is consistently higher than stress score, with a significant standard deviation.
- 4ch: Rest score is slightly lower than stress score, with a moderate standard deviation.
- 2ch: Rest score is consistently lower than stress score, with a small standard deviation.

Overall, the graph shows a general trend of higher scores during stress conditions compared to rest conditions, with some locations showing more variability than others.
