Graph showing RER (Respired Expiratory Ratio) over time for three conditions: Raisins, Chews, and Water. The graph indicates a consistent decrease in RER over time for all conditions, with a notable difference between the conditions, particularly at the 40-minute mark. The RER values range from approximately 0.85 to 1.00, with the Raisins condition showing a slightly higher RER compared to the Chews and Water conditions at most time points.
