Figure 6. The frequency of responding SVV-specific T cells. The frequency of SVV-specific T cells in (A-D) BAL and (E and F) PBMC producing IFNγ, TNFα and IFNγ/TNFα was measured by intracellular cytokine staining following stimulation with either (A, B, E and F) SVV lysate or (C and D) overlapping peptide pool (SVV ORFs 4, 31, 61 and 63), average ± SEM. SVV BAC (white bar) and WT SVV (black bar).
