Figure 5, Hudson 2009

The graph shows the virus titer (%) over three rounds. Each round is depicted with bars for Control (black), EF (white), and Tamiflu (gray). The y-axis represents the virus titer percentage, ranging from 0 to 120, while the x-axis indicates the rounds: 1st, 2nd, and 3rd. The 1st round shows a significant increase in virus titer for Tamiflu compared to the other treatments, with EF and Control showing minimal changes. The 2nd round shows a similar trend, with Tamiflu again having a notable increase. The 3rd round displays a slight decrease in virus titer for Tamiflu compared to the previous rounds, while EF and Control remain relatively stable.
