Figure 10 Intra-hemispheric delta power (in µV²/Hz). Group mean (± S.E.) log transformed Intra-hemispheric delta power (in µV²/Hz) asymmetry values (y-axis) for seven site pairs (x-axis) in PD patients and normal controls during emotional stimuli. More negative numbers indicate less delta power. Lower numbers (i.e., more negative) are associated with increased activation [45]. The significant site pair \( p < 0.05 \) differences between the groups were marked as *.
