Figure 8 Inter-hemispheric alpha power (in $\mu V^2/Hz$). Group mean (± S.E.) log transformed inter-hemispheric alpha power asymmetry values (y-axis) for seven site pairs (x-axis) in PD patients and normal controls during emotional stimuli. More negative numbers indicate less delta power. Lower numbers (i.e., more negative) are associated with increased activation [45]. The significant site pair ($p < 0.05$) differences between the groups were marked as *.
