**Test phase**

Starting with **Ritalin (methylphenidate)** as the first choice of medicine in the test phase.
1) 5 mg x 2-3
2) 10 mg x 2-3
3) 15 mg x 2-3
4) 20 mg x 2-3

**Stabilization phase**

Along with the parents, a depot preparation corresponding to fast-acting **methylphenidate** in equipotent doses is considered.

**Second choice**

If there is no effect on this preparation, **dexamphetamine** is tested as second choice in the following increase (this preparation is not given if danger of abuse is suspected);
1) 5 mg x 2
2) 10 mg x 2 (if no effect on 1)

**Third choice**

In case of suspicion of abuse of dexamphetamine or a significant anxiety component, change to **Strattera** (atomoxetine) is considered as third choice in the following increase: 1.2 to 1.4 mg per kg per day.

**Two-track treatment**

When the ADHD medicine is tested, an observation period of at least 8 months will be aimed at before a two-track treatment is decided on. (Two-track treatment is supplementary treatment with e.g. neuroleptics, antidepressants or antiepileptics etc.)
