Your patient may have suffered from a TIA and the estimated seven day stroke risk is Low

You have two management options:

a) Refer to TIA Clinic AND (before patient leaves surgery):
Initiate/continue ALL of the following Medications:
Clopidogrel OR Aspirin +/- Dipyridamole (UNLESS patient is on Warfarin or Dabigatran)

AND
Statin AND Antihypertensive

AND
Counsel patient on Smoking Cessation AND No Driving for minimum of 1 month.
Print TIA Information Leaflet

OR
b) Arrange comprehensive TIA/stroke work-up in the community (see 'Management' tab).

ATTENTION: Please ensure that all referrals and prescriptions are appropriate and correct prior to handing them to the patient - this software is intended as a tool to support, but not replace practitioner clinical judgement.
