**Severe distress or disease, unconsciousness or comatose, co-morbid condition, meningitis**

**Negative TST does not rule out TB. Evaluate further if strongly suspected**

$ Prolong unexplained illness such as cough, fever, weight loss, lymphadenopathy, abdominal mass, hepatosplenomegaly, failure to thrive etc. and strong history of contact with a TB case in family

‡Absence of above

---

**SUSPECTED CHILD**

Administer PPD

*Child seriously ill? If yes refer to tertiary center

- **Positive:**
  - TST >10 mm
  - Do a CXR
  - AFB smear-sputum or Gastric
  - Apply PPA Scoring

  - AFB sputum smear positive
    - Declare TB and Register
  - Gastric aspirate positive
  - CXR sugg PPA score>7
  - CXR not sugg PPA score< 7

  - Give antibiotics and evaluate after 7-10 days

- **Negative:**
  - TST < 10mm

  - STB strongly suspected
  - YTB not strongly suspected

  - If no response refer to tertiary center
