84 eligible patients
- Taking low-dose aspirin with either 40 mg/day of famotidine or 15 mg/day of lansoprazole for at least 3 months
- Age >20 years
- No history of surgery for esophageal, gastric or duodenal diseases
- Neither known gastroduodenal bleeding nor gastroduodenal ulcers within the previous 12 months
- Neither acute coronary syndrome nor stroke with the previous 3 months
- Absence of severe heart failure (New York Heart Association functional class IV)
- No use of steroids or non-steroidal anti-inflammatory drugs
- No malignant diseases

6 patients (2 with famotidine use and 4 with lansoprazole use) refused to undergo upper gastrointestinal endoscopy.

31 with famotidine use and 47 with lansoprazole use were enrolled in this cross-sectional study.
