The graph below illustrates the growth patterns of three different mouse strains: Wistar, SD, and SD high protein, across different ages (in days) and weights (in grams). The data is represented by data points and error bars, indicating the variability in weight at each age. The graph shows a clear trend of increased weight over time for all strains, with the Wistar strain generally reaching the highest weight at older ages. The SD high protein strain, indicated by green triangles, appears to show a different growth pattern compared to the other two strains, with a lower weight at younger ages but catching up with the other strains as they grow older.
