The graph shows the effect of different concentrations of Aldosterone (nM) on the intracellular sodium concentration ([Na⁺]ᵢ, mM). The x-axis represents the concentration of Aldosterone (nM), and the y-axis represents the intracellular sodium concentration. The graph includes data points for Vehicle, 0.1 nM, 1 nM, 10 nM, and 100 nM Aldosterone. The 100 nM concentration shows a significantly higher [Na⁺]ᵢ compared to the other concentrations, indicated by an asterisk (*).
