The graph shows the relative fluorescent units (rfu) as a function of time post bloodmeal (h) for rabbit and chicken blood. The x-axis represents the time post bloodmeal in hours (18, 24, 30, 48, 72). The y-axis represents the rfu values. The data indicates that the rfu values for rabbit blood are consistently higher than those for chicken blood, especially at 48 hours post bloodmeal. The error bars indicate the variability in the measurements.
