The diagram illustrates the flow of context information through a system:

1. **Clients Management**
   - The system has three main components: Clients Management, Context Aggregation, and Context Propagation.
   - The system is called the Radiator Server.

2. **Middleware**
   - Context messages are propagated to the Middleware layer.

3. **Client A, B, N**
   - Clients A, B, and N interact with the Middleware, passing context messages.

4. **Propagate context**
   - The system iterates, with each client receiving and propagating context messages to the next client, forming a circular flow.
   - This process continues from Client A to Client B, then to Client N, and back to Client A, ensuring continuous context exchange.

The system is designed to handle context aggregation and propagation efficiently, ensuring that context information is seamlessly exchanged among clients.
