The image shows bar graphs comparing the expression of CD11a and CD11b under different conditions.

- **CD11a**
  - Basal conditions show a lower expression compared to +TNFα 25ng/ml conditions.
  - The +TNFα 25ng/ml condition shows a higher expression compared to the Basal condition.

- **CD11b**
  - Similar expression trends are observed for CD11b as for CD11a.

The graphs indicate that TNFα stimulation leads to increased expression of CD11a and CD11b compared to basal conditions.
