Random effects meta-analysis
Occurrence rate of reported clinical manifestations among observational studies involving patients with similar baseline characteristics and type of ventilatorystatus

1°Endpoints
Difference in reported risk of adverse hemodynamic complications among patients receiving PPV as opposed to those breathing unassisted

2°Endpoints
Difference in reported risk of other clinical manifestations among patients receiving PPV as opposed to those breathing unassisted

Sensitivity analyses
Re-analysis of 1/2 endpoints using
1) Only cases where two investigators agreed that the diagnosis represented a TPTX or aligned with a working definition
2) Datasets where unclear/unreported data treated as missing
