Figure 1.

Identification of the causes of 'discomfort' (e.g. agitation, anxiety, pain, dyspnoea, disappointed expectations of the patient)

Structured assessment to identify causes of patient-related NIV failure

Attempt non-pharmacological remedy of 'discomfort' (E.g. sophrology, and/or patient education in advance of NIV)
Special attention to effects of ill-fitting or inappropriate face masks on patient acceptance of NIV

If difficulties persist - consider possible benefits of sedation as an adjunct to NIV
