The graph compares the number of queries executed per second for different types of queries using two approaches: the Proposed Approach and the Extn. Table Approach.

- **Insertion**: The Proposed Approach outperforms the Extn. Table Approach.
- **Deletion**: The Proposed Approach significantly outperforms the Extn. Table Approach.
- **Updation**: The Proposed Approach performs better than the Extn. Table Approach, but the difference is not as significant as in Insertion and Deletion.
- **Selection**: The Proposed Approach significantly outperforms the Extn. Table Approach.

The y-axis represents the number of queries executed per second, ranging from 0 to 1200.
