Figure 1.

The graph shows the arthritis index over time for different groups of animals. The y-axis represents the arthritis index, while the x-axis represents the days after immunization. The graph includes three lines:

- Black diamonds with error bars: Controls
- Black squares with error bars: Tolerized
- Gray squares with error bars: CIA

The legend indicates that the black diamonds represent controls, the black squares represent tolerized, and the gray squares represent CIA feeding. The data points are scattered across the graph, showing variations in the arthritis index over the specified days.
