(a) The figure shows the relationship between age (years) and the TREC-content (% of total CD4+ T-cells) for different groups: Control, Remission G1, and Remission G2. The data points suggest a decrease in TREC-content with increasing age.

(b) The graph illustrates the correlation between IL-7 (pg/ml) and TREC-content (% of total CD4+ T-cells) for ACR and Non-ACR groups. The trend lines indicate a positive correlation, with higher IL-7 levels associated with higher TREC-content.
