Additional Figure 1.  **TIV-specific IgG memory B cell frequency.** Total B cells were isolated at baseline and 1 and 6 months following immunization with 2006/2007 through 2009/2010 TIV, cultured with CpG and IL-2 for 4 days, and TIV and total IgG specific EliSpots performed to determine the frequency of TIV-specific memory B cells. An individual subject may have provided data from multiple study years. No statistical difference (p<0.05) was detected among groups at individual time points.
