Suppl. Figure 3

(a) Bar charts showing the percentage of attached cells over time for different cell lines. The graphs compare the effects of vector and + Cre conditions on NDL2-5 and NDL2-5/FAK<sup>flx/flx</sup> cell lines at 15 min and 120 min.

(b) Microscopic images illustrating the attachment patterns of the same cell lines under vector and + Cre conditions. The images highlight the differences in cell morphology and attachment characteristics between the two conditions.
