Supplementary Figure S1. Comparison of discriminatory protein peaks detected on H50, IMAC30, CM10 and Q10 protein chip arrays. Determined by univariate analysis, 14 peaks from H50 (A), 12 from IMAC30 (B), 13 from CM10 (C), and 12 from Q10 (D) were significantly either up- or down-regulated (p<0.005) in sera from BC patients compared to HV patients.
