The graphs show the changes in RVR, RBF, GFR, and FF across three conditions: C, M1, and M2.

- **RVR (mmHg/mL/min)**: The RVR decreases from condition C to M1, and then stabilizes in M2.
- **RBF (mL/min)**: The RBF increases progressively from condition C to M2.
- **GFR (mL/min)**: The GFR remains relatively constant across the three conditions.
- **FF**: The FF values show a slight decrease from C to M1, then stabilizes in M2.

Each condition is represented by a data point with error bars indicating variability. The asterisks (*) indicate statistically significant differences between conditions.
