The diagrams show the absolute change in NfH levels compared to baseline (ng/ml) on the y-axis, measured in days after admission on the x-axis. Each panel represents a different group based on ICU-AW status and presence of neurological co-morbidities.

- **A**: No ICU-AW with no neurological co-morbidities, N:51
- **B**: ICU-AW with no neurological co-morbidities, N:16
- **C**: No ICU-AW with any neurological co-morbidities, N:21
- **D**: ICU-AW with any neurological co-morbidities, N:5
- **E**: No ICU-AW with any neurological co-morbidities, N:30
- **F**: ICU-AW with any neurological co-morbidities, N:11

The graphs illustrate the trend in NfH levels over time for each group, highlighting potential differences in response to ICU-AW and co-morbidities.
