The graph shows the comparison of EPC (endothelial progenitor cells) percentage among healthy, CAD, and CPR groups. The healthy group (n=5) had the lowest EPC percentage, followed by the CAD group (n=11) with a slightly higher percentage. The CPR group (n=15) had the highest EPC percentage, indicated by the asterisk symbol. There is a significant difference between the CPR group and the healthy group, as indicated by the double asterisk symbol.
