Kaplan-Meier plots for multiple GNS signature score thresholds. Survival curves illustrate the association between GNS signature and patient survival for three independent glioblastoma data sets and a range of percentile thresholds on GNS signature score (from top: 15th, 20th, 30th, 50th, 70th, 80th and 85th percentile). Higher scores indicate greater similarity to the GNS expression profile. Hazard ratios and log-rank P-values were computed by fitting a Cox proportional hazards model to the data.
