Figure S3
Segregation of fertile and sterile plants in T₁ progeny.

(a) Segregation of the transgenes (PPR782a and HPT) in each T₁ plant obtained by self-pollination of No. 13 plant. The lowest panel indicates control PCR amplifying tubulin genetic region. Seed setting rates of each T₁ plant are shown under the panel. (b) Representative anthers of T₁ plants with the introduced PPR782a are yellow and engorged. On the other hand, null segregants produced stunted anthers as those of WAA.
