Sup Figure 1. Validation of lox-Cre excision of *Efnb2*.
A. *Efnb2* in situ hybridization on transverse sections of the neocortex of E11.5 control and *Efnb2*$_{lox/lox}$; *Nes*$_{Cre}$ embryos. Scale bars: 500 µm.
B. *Efnb2* in situ hybridization on transverse sections of the neocortex of E13.5 control and *Efnb2*$_{lox/lox}$; *Nex*$_{Cre}$ embryos. Scale bars: 500 µm.
Sup Figure 2. Decreased numbers of neurons in *Efnb2* mutants is not due to defective migration or increased apoptosis.

A. Transverse sections of the neocortex of E16.5 control and *Efnb2*<sup>lox/lox</sup>; Nes-Cre embryos were immunostained for Satb2 (green) and stained with Draq5 (grey). The intermediate zone was delimited based on Draq5 staining (white outline).

B. Quantification of the IZ surface area of control (n=3) and *Efnb2*<sup>lox/lox</sup>; Nes-Cre (n=5) embryos.

C. Quantification of the number of cleaved caspase3+ cells per hemisphere in control and *Efnb2*<sup>lox/lox</sup>; Nes-Cre embryos at two different developmental stages (indicated).

Data are reported as mean ± SEM, Mann Whitney test (*P < 0.05). IZ : intermediate zone. Scale bars: 500 µm.
Sup Figure 3. Quantification of neuron numbers by type (Tbr1+ and Satb2+) at different developmental stages.

A-E. Quantification of Tbr1+ and Satb2+ neuron number at each developmental stage in both genotypes. At E13.5, the data is highly variable from embryo to embryo. At E14.5, the statistically significant decrease in total neuron numbers is due to a non statistically significant decrease in both Tbr1+ and Satb2+ neurons while at E16.5, only Satb2+ neurons are decreased, suggesting that the number of Tbr1+ neurons has been compensated by this stage.

F. Quantification of Tbr1- Satb2- neuron numbers at different developmental stages.

Data are reported as mean ± SEM, 1-way ANOVA with Bonferroni’s multiple comparison test (***P < 0.001).
Sup Figure 4. Cell cycle analyses.

A. Transverse sections of the neocortex of E13.5 control and Efnb2\textsuperscript{lox/lox}; Nes-Cre embryos were immunostained for Tbr2 (green), Tbr1 (red) and stained with Draq5 (grey). Scale bars: 50 µm.

B. Quantification of the fraction of Tbr2+ cells that express Tbr1 in E13.5 control and Efnb2\textsuperscript{lox/lox}; Nes-Cre embryos (n=3).

C. Estimation of cell cycle length of Tbr2- and Tbr2+ progenitors in control (n=6) and Efnb2\textsuperscript{lox/lox}; Nes-Cre (n=5) E13.5 embryos. The data for Tbr2+ progenitors is highly variable in both genotypes underlying the difficulty of using this method for this population of progenitors.

Data are reported as mean ± SEM. Scale bar represents 50 µm.
Sup Figure 5. Injection of EphB2-Fc in the lateral ventricle does not modify neuron numbers.

A. Transverse sections of the neocortex of E15.5 control injected embryos (IgG) (n=4) and embryos injected with EphB2-Fc (n=4) were immunostained for Tbr1 (red) and Satb2 (green). Scale bars: 50 µm.

B. Quantification of the number of neurons in the neocortex of E15.5 embryos. The graph represents total neuron numbers (Tbr1+ and Satb2+ neurons in lateral, central and medial regions of the neocortex) in control and EphB2-Fc injected embryos. Data are reported as mean ± SEM.
