Additional Figure 1. Kaplan-Meier survival curves comparing patients ≥70 years choosing dialysis or conservative care, from treatment decision: overall comparison of both groups (part A; median survival: 3.2 [1.5-6.0] versus 1.4 [0.7-2.9] years); after stratification of age (B and C); after stratification of Davies comorbidity scores with no and intermediate comorbidity taken together versus severe comorbidity (D and E).
