**Supplementary figure 1** Impact from degree of relatedness in FCCTX families in the 6 extra-colorectal cancer types that were significantly different from the population-based cohort. A) Table showing the number of cancers observed and the mean age at onset in individuals affected with colorectal cancer, their first-degree relatives and their second-degree relatives. B) Incidence rates calculated separately in individuals affected by colorectal cancer (red), first-degree relatives (blue) and second-degree relatives (green). No significant differences were observed. Incidence rates and p values are available upon request.
