**Additional Figure S8:** No influence of XRCC1 KD in siSp1 or IR treated cells grown at 5% FCS. A-B) Comparable growth of siCon and siSp1 cells at 5% FCS. Phase-contrast images of Control (A) or Sp1 KD (B) cells. Images are from one representative experiment (from a total of n = 3 independent experiments), with two different fields randomly chosen on each plate shown per condition. Scale bar = 400 µm. C-F) Growth of control or IR treated cells at 5% FCS. Phase-contrast images of Control (C) or cells treated with different amounts of IR (D–F). Images are from one representative experiment (from a total of n = 4 independent experiments), with two different fields randomly chosen on each plate shown per condition.
