Algorithm: Moderate pre-eclampsia

Preeclampsia: Diastolic Blood Pressure (DBP) ≥90 mmHg and proteinuria > 0.3 g/l (two crosses)

Term of pregnancy

≤36 weeks of amenorrhea

In labour

No

Yes

Signs of severity:
- Convulsions
- Troubles of consciousness
- Jaundice
- TAD ≥ 110 mmHg
- Massive proteinuria
- Imminent eclampsia with at least the presence of two of these signs: vision disorders, headache, epigastric pain, osteo tendon hyperreflexivity, seizures,

≤34 weeks of amenorrhea

Yes

No

Favorable evolution

Medical treatment and surveillance until 37 weeks of amenorrhea

No

Yes

Corticotherapy

Planned caesarean section

Caesarean section in labor

Failure

Success

Vaginal delivery

Emergency caesarean section within 30 minutes

>36 weeks of amenorrhea

In labour

Yes

No

Medical treatment and monitoring of fetal wellbeing

Induction

Cervix and clinical conditions favorables

Favorable evolution:
Stable blood pressure, absence of signs of severity, good progress of labor

Yes

No

Imminent delivery
