Survival analysis comparing Insulin and No-Insulin treatment groups. The graph shows a statistically significant difference between the two groups, with a p-value of 0.04. The number of patients at risk is indicated for each time point, with the Insulin group starting with 157 patients and the No-Insulin group starting with 738 patients. The survival curves for Insulin and No-Insulin treatments are depicted, with the No-Insulin curve consistently below the Insulin curve, indicating better survival for the Insulin group.
