Suppl. Fig. 3

(a) Western blot analysis of Gli1, β-catenin, Lamin B1, and α-tubulin in cell extracts from DMSO and 6BIO treated cells after 72h. The graph shows the signal intensity for each protein compared to control (C) and nuclear (N) samples.

(b) Immunofluorescence images of DAPI, pH3, and merge for DMSO and 6BIO treated cells after 72h. The bar graph shows the proportion of pH3+ cells out of total cells, with significant differences indicated.
