**Figure S1.** Production of VLRB antibodies in lampreys after HopM1<sub>1-300</sub> immunization.

ELISA results for VLRB production from dilutions of plasma from three lampreys immunized with HopM1<sub>1-300</sub> conjugated to Jurkat T cells and a control non-immunized lamprey (naïve). Binding of VLRBs to HopM1<sub>1-300</sub>-coated plates was detected with a mouse monoclonal antibody and an alkaline peroxidase conjugated goat anti-mouse IgG polyclonal antibody. Absorbance at 405 nm (A<sub>405</sub>) was measured 30 minutes after addition of an alkaline peroxidase substrate. Lamprey-1 showed the highest response to HopM1<sub>1-300</sub>. 
Figure S2. VLRBs can be targeted to intracellular compartments.

Visualization of intracellular accumulation of YFP, syntaxin SYP61 (*At1g28490*), and VLR<sub>M1</sub> fused to SYP61 in *Nicotiana benthamiana*. Images were taken with the Olympus IX71 inverted microscope using the YFP filter (excitation 500/24, emission 542/27). White bar length represents 50 µm. Image brightness increased 15% for YFP, and 20% for the other 2 images. Notice how the YFP fluorescence pattern is similar for SYP61 (which localizes to the early endosome/trans-Golgi network; Sanderfoot *et al.* 2001, Stefano *et al.* 2010) and for VLR<sub>M1</sub>-SYP61.
Figure S3. In planta interaction of HopM1 with VLR\textsubscript{M1}.

Co-immunoprecipitation (co-IP) of HopM1 and its corresponding VLRB in Nicotiana benthamiana. Interactions between HopM1 and VLR\textsubscript{M1} were tested with both proteins fused to 2 different epitope tags (HA and cMyc). Highlighted in orange are those proteins detected in the Western blot, while in black are those proteins also expressed but not detected. As negative controls for the co-immunoprecipitations, different proteins that had low or no expression were co-expressed with HopM1 or VLR\textsubscript{M1} (data not shown). No reducing agents were used in the buffers. Abbreviations used: VLR\textsubscript{M1} = SP-VLR\textsubscript{M1}, and M\textsubscript{1-300} = SP-HopM1\textsubscript{1-300}.

a Total protein input of HA and c-Myc tagged proteins. Proteins were detected with α-HA and α-cMyc antibodies, respectively. Ponceau S staining of the PVDF membrane is shown below the Western blot image.

b Immunoprecipitation (IP) using α-HA agarose beads. The IP (α-HA antibodies) and co-IP (α-cMyc antibodies) Western blots are shown.

c Reciprocal immunoprecipitation using α-cMyc agarose beads. The IP (α-cMyc antibodies) and co-IP (α-HA antibodies) Western blots are shown.
Figure S4. Hypothetical modifications to VLRs to diversify their in planta use.

Abbreviations used: NBS = nucleotide-binding site, RLK = receptor-like kinase, RLP = receptor-like protein, and VLR = variable lymphocyte receptor.
