Supplementary Figure 1. Conditional removal of Floxed RFP from engineered HEK293 genome by cumate induction. Engineered HEK293 cells were transfected with cumate inducible Cre-lentivector (A-C) or control plasmid DNA without Cre for 24 hours (D-F). Cumate was added to induced the Cre expression. Images were taken for live cells in culture at 5 days following induction. The disappearance of RFP in cells (outlined in yellow and marked with *), indicating the removal of floxed RFP in the transfected cells (A-C). Under the same experimental condition, the control panels show no significant disappearance of RFP in imaged cells (D-F).
