Figure S3. Induction of ILEI secretion by plasmin, TGFβ and uPA and efficient uPAR KD by stable RNAi in EpRas cells. (A) Western blot analysis of ILEI in whole cell lysates and CM of EpRas cells non-treated or treated with purified plasmin of the indicated concentrations for 24 hours after serum withdrawal. (B) Western blot analysis of ILEI in whole cell lysates and CM of EpRas cells without treatment or following TGFβ-1 (10 ng/ml), plasmin (10 mU/ml) or a combined treatment for 16 hours after serum withdrawal or reduction to 4%. (C) Western blot analysis of ILEI in whole cell lysates and CM of EpRas cells harvested 24 hours after serum withdrawal and incubated with recombinant TGFβ-1 (10 ng/ml) or purified plasmin (10 mU/ml) for the indicated periods of time before harvest. (D) Western blot analysis of ILEI in whole cell lysates and CM of EpRas cells non-treated or treated with purified active uPA of the indicated concentrations for 24 hours after serum withdrawal. (E) Relative uPAR mRNA expression of EpRas cells stably expressing non-targeting (shCont) or uPAR-targeting shRNAs (sh_uPAR #1-#5) determined by quantitative real-time PCR and normalized to GAPDH mRNA levels. Error bars show standard deviation of triplicates.
