**Figure S1. IgG response to cE5 and gSG6 in different age groups.** Scatter plots reporting levels of IgG antibodies to the cE5 and gSG6 proteins in the 207 individuals stratified in five age groups as indicated (1-5 n=23; 6-10 n=25; 11-15 n=49; 16-30 n=52; >30 n=58). Bars represent median values. IgG levels are expressed as OD_{492}. P values were determined by the Kruskal-Wallis (cE5 p=0.0072; gSG6 p=0.0442) and the Mann-Whitney tests (*, p<0.05; **, p<0.01). Note that one data point is outside the axis limits.
