The image shows a series of scatter plots comparing log2(Coverage) for different loci (LGa to LGp) across two strains, Bge3 and B. glabrata. Each plot represents the distribution of log2(Coverage) values for a specific locus, with red points indicating the data points. The y-axis represents the log2(Coverage) values, ranging from -2.5 to 10.0, and the x-axis represents the different loci.
