Supplemental Figure S5: H3K27ac ChIP-seq analysis after hit-and-run epigenetic editing. A. Density scatter plot of H3K27ac ChIP-seq signal in HCT116 cells 24 days after treatment with Ezh2-dCas9, D3A-dCas9 and D3L in comparison to dCas9 control treated cells. Target site in the HER2 promoter is indicated with a red dot. B. Overlap analysis of H3K27ac peaks from cells treated with Ezh2 plus D3A and D3L with control cells treated with dCas9 without ED. C. The fold-change (-dCas9/Ezh2+D3A+D3L) of peak scores is plotted against the ChIP-seq signal in the dCas9 control sample. ChIP-seq peaks with >2 fold change are represented as black dots. HER2 target site is indicated with a red dot.
