A patient presents with newly diagnosed colon cancer liver metastasis with the following characteristics:

• age 55 years
• ECOG performance status 0 (fully active, able to carry on all pre-disease performance without restriction)
• synchronous presentation with colon primary removed 1 month ago, no chemotherapy given
• 5 tumors in a single lobe of the liver
• largest metastasis 2 cm
• 45% of liver needs to be resected to remove all metastatic disease
• resectable solitary lung metastasis

Which course of therapy would you recommend?

○ Surgical resection – immediate curative-intent surgery with possible adjuvant chemotherapy
○ Chemotherapy followed by re-staging and possible subsequent surgical resection
○ Chemotherapy only – no surgery
