Reviewer’s report

Title: No correlation between minimal electrical charge at the tip of the stimulating catheter and the efficacy of the peripheral nerve block catheter for brachial plexus block: a prospective blinded cohort study.

Version: 2  Date: 24 March 2014

Reviewer: gianluca cappelleri

Reviewer’s report:

After revision the authors improved quality of their MS, but minor essential revisions remain.

The authors modified their conclusions to "data show that there is no correlation between the MEC and morphine consumption". Only this sentence is corrected and supported from the results. All references about costs and performance of stimulating catheters are speculation not correctly investigated and should be delete from discussion.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.

Declaration of competing interests:
