Reviewer's report

Title: Multidisciplinary assessment of tako-tsubo cardiomyopathy: a prospective case study

Version: 1 Date: 2 January 2011

Reviewer: Nicolas Mansencal

Reviewer's report:

This is an interesting article. The authors have included 13 patients presenting with Tako-Tsubo cardiomyopathy and several imaging techniques have been performed.

The authors concluded that Tako-Tsubo cardiomyopathy is associated with altered cardiac autonomic function.

I have several remarks to address.

1. This small population should be more described in Table 1, according to previous works (pattern of Tako-Tsubo cardiomyopathy: typical?, apical sparing variant?; what was the precipitating factor?...).

2. Results of conventional ECG should be detailed.

3. What was the statistical software used for the statistical analysis? This should be added.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
